

LogiMind prototype Demo guide

A step-by-step script for demoing the tenant-staff workflow: from a customer's plain-language request to RFQs, vendor comparison, the customer quote, the live shipment and the partner network.

Length	Audience	Prototype	Demo date inside the app
15–20 minutes	Forwarders, 3PLs, investors	v0.4 · 8 screens	Tue 10 Nov 2026

The story you'll tell

Dewi Lestari runs operations at **PT Nusantara Cargo**, a freight forwarder in Jakarta. Her customer **PT Kopi Nusantara** wants to ship **2 × 40ft containers of green coffee beans from Surabaya to Shanghai** in mid-November, FOB. Today that job lives in WhatsApp, email and Excel. In LogiMind, one prompt turns it into a structured request, a compliance checklist and RFQs to her own vendors, and every party sees only their part.

Act 1 · 2 min

Home overview

What needs Dewi today

Act 2 · 4 min

Prompt → RFQs

One sentence becomes 4 RFQs

Act 3 · 3 min

Compare & award

AI finds the hidden costs

Act 4 · 3 min

Customer quote

Margin in, vendors out

Act 5 · 3 min

Shipment workspace

One shipment, many views

Act 6 · 3 min

Network & invite

Build the ecosystem

Setup and ground rules

5 minutes
before the audience joins

1. Start the prototype

Open a terminal and run:

```
python3 -m http.server 5180 --directory /Users/raam/project-raam/nirvana/LogiMind
```

Then open `http://localhost:5180` in Chrome. The prototype is plain HTML: no build step, no login, no backend.

2. Prepare the browser

- Use a window at least **1280 px wide** (1440 px is ideal). Hide bookmarks and extensions, and zoom to 100%.
- Open the six act URLs (listed on the last page) in tabs so you can jump back if you lose your place.
- Close notifications. The demo uses small toast messages at the bottom of the screen; point at them when they appear.

✓ **Reloading resets everything.** Every page starts from the same sample data. If you click something wrong, reload the page and carry on.

! **The AI is scripted.** Whatever you type in the prompt, the answer is always the coffee shipment. Use the **Export FCL** chip so the prompt matches the answer.

3. Three messages to land

Prompt-first

Staff describe a job in plain language; the AI does the structuring, the compliance homework and the RFQ drafting. **Humans always confirm** before anything is sent.

Your own ecosystem

The forwarder brings its vendors and customers onto LogiMind. Vendors can reply from a WhatsApp link without an account.

Everyone sees only their part

Customers never see vendor names or costs. Vendors never see the customer's price or each other. Every shared screen states "**Visible to: ...**". This is the thing to repeat throughout the demo.

4. Cast of characters

Who	Role in the demo
Dewi Lestari, PT Nusantara Cargo	You. Operations at the forwarder (the paying tenant).
PT Kopi Nusantara (Sari Wulandari)	The customer: a coffee exporter in Surabaya.
PT Truk Jaya, PT Logistik Brantas, CV Angkut Timur	Trucking vendors. CV Angkut Timur isn't on LogiMind (link only).
CV Fumigasi Prima	Fumigation vendor. Their draft certificate has an error.
PT Bea Cepat	Customs broker (PEB and Form E).
Samudra Lines Agency, Pacific Bridge Shipping	Ocean carrier agents competing on the sea leg.

Point: a forwarder's morning in one screen. Everything is sorted by deadline, and every item says who can see it.

Home: prompt box, pipeline strip, Needs attention, active shipments, and the 7-day side column.

Do

Say / point out

- 1 Open `localhost:5180`.
- 2 Point at the **pipeline strip** (Requests → Cleared).
- 3 Walk down **Needs attention**.
- 4 Point at the right column: **Next 7 days, Network activity, Lane updates**.
- 5 Scroll back to the prompt box at the top.

From one prompt to four RFQs

 4 min
 chat.html

Point: one sentence becomes a structured request, a compliance checklist for Indonesia → China, and RFQs split by leg with vendors ranked from Dewi's own network. Nothing is sent until she confirms.

Do	Say / point out
1 On Home, click the chip Export FCL , then press Enter .	"Sari from Kopi Nusantara sent this on WhatsApp. Dewi just pastes it."
2 Let the reasoning steps run (≈ 3 seconds).	Matching the customer, guessing the HS code, checking rules, splitting legs, ranking vendors.
3 On Structured request , point at the grey/blue labels beside each field.	Every value says where it came from: <i>your prompt</i> , <i>customer profile</i> or <i>AI guess</i> . HS 0901.11 at 92% confidence.
4 Click the orange Consignee field, type Shanghai Aroma Trading Co. , and click outside it.	The card flips to Complete and the field is marked <i>Edited</i> . The AI proposes; Dewi decides.
5 On Documents & compliance , read the FOB warning. Click Request on Commercial invoice.	The AI knows that under FOB the buyer usually books ocean freight. The document request goes only to the customer, as the "Visible to" line says.

The screenshot displays the Nusantara Cargo web application. The left sidebar contains navigation options: Home, Shipments, Assistant, RFQs, Network, Docs, Planner, and More. The main content area is titled "2 x 40ft coffee · SUB → SHA Draft" and includes a status bar with "Request", "Checklist", "3 RFQs", "Compare", and "Quote".

A summary box states: "2x40ft coffee beans Surabaya to Shanghai mid-November, FOB. For Kopi Nusantara, pickup from their Rungkut warehouse." Below this, a message reads: "I've turned this into a structured request for PT Kopi Nusantara, checked the Indonesia → China rules for green coffee, and drafted 4 RFQs split by leg with vendors from your network. Check the highlighted items, then review and send."

The "Structured request REQ-0311" section shows a table of details:

Customer	Pickup	Port of loading
PT Kopi Nusantara	Kopi Nusantara warehouse, Rung...	Tanjung Perak, Surabaya (IDSUB)

Below this, a table shows "Port of discharge" (Shanghai (CNSHA)), "Cargo" (Green coffee beans (Arabica), no...), and "HS code" (0901.11, 92% confidence). Other fields include "Equipment" (2 x 40ft dry), "Weight / packing" (~38.4 t · 640 jute bags x 60 kg), "Incoterm" (FOB Tanjung Perak), "Cargo ready" (Wed 11 Nov), and "Target ETD" (14-18 Nov). The "Consignee (Shanghai)" field is marked as missing.

The "Documents & compliance ID → CN - HS 0901.11" section lists three missing items:

- Green coffee (0901.11) is not restricted for export from Indonesia.
- Import into China needs GACC registration for the overseas producer, plus inspection and quarantine on arrival.
- Under FOB, ocean freight is usually booked and paid by the buyer. Confirm with PT Kopi Nusantara before quoting it.

A table below shows "Document", "Provided by", and "Status" for a "Commercial invoice" provided by PT Kopi Nusantara.

The prompt, the AI's summary and the editable structured request.

6 Scroll to **Draft RFQs by leg**.

Four RFQs: trucking, fumigation, customs, ocean. Vendors are ranked by lane fit, on-time rate and last price. **CV Angkut Timur** is "Link only": not on LogiMind, so they get a WhatsApp link. Fumigation warns there's only one vendor. Marketplace is marked "Coming soon".

7 On Trucking, click **Preview as vendor**.

This is exactly what PT Truk Jaya sees. Read the red **Hidden from this vendor** list: customer price, margin, other vendors, other legs. Close it.

8 Change the currency from **USD** to **IDR**, then back.

Prices in rupiah for local partners.

9 Click **Review & send**, then **Send 4 RFQs**.

"Human in the loop: the AI drafts, Dewi confirms." The status becomes **RFQs out** and the progress bar moves to **Compare**.

10 In the green bar, click **Open RFQ-0194**.

"Fast-forward a few hours. The replies are in." → **Act 3**.

Draft RFQs: scope the vendor sees, suggested vendors with match scores, and the visibility line on every leg.

i If someone asks "what if I type something else?": the prototype always plans the coffee shipment and says so on screen. In the product, the same flow works for any lane.

Compare replies and award

 3 min
rfq.html

Point: the AI doesn't just sort by price. It adds the charges vendors left out, catches expiring rates, and explains the trade-off.

RFQ-0194: 6 of 7 replies, the AI recommendation, and offers side by side per leg.

Do

Say / point out

- 1 Read the purple **AI recommendation** card (US\$3,575).

"US\$210 more than the cheapest, but 5 days faster, sailing on the target date, and no rate-expiry risk."

- 2 Click **Lowest cost**, then **Recommended**.

The cheapest option is US\$3,365, and the AI tells you why it's risky. Dewi can also pick vendors by hand (the card then says *Custom*).

- 3 Scroll to **Ocean freight** → Pacific Bridge card.

Two catches: **BAF not quoted** (+US\$165 per container added to compare fairly) and **the rate expires the day before its ETD**.

- 4 Scroll up to **Trucking** → Logistik Brantas.

Cheaper on paper, but only 2h waiting included; loading 640 bags takes 3–4h. Normalized, it costs more than Truk Jaya.

- 5 On CV Angkut Timur, click **Nudge on WhatsApp**.

Partial replies are normal; chasing is one click.

- 6 Click **Award 4 legs** → **Award & request bookings**.

Losing vendors are told **without seeing any prices**. Then click **Build customer quote** → Act 4.

Build the customer quote

 3 min
quote.html

Point: vendor costs and margin stay internal (left); the customer sees a clean quote in **Nusantara Cargo's own brand** (right), with vendor names removed automatically.

Left: internal costs and margin. Right: the live, tenant-branded preview the customer will receive.

Do

Say / point out

- Point at the black **Internal only** badge, then at the teal preview.
White-label: the customer sees Nusantara Cargo's logo, colour and portal address. LogiMind is just a small footer.
- Change the ocean margin from **10** to **15**.
The sell price, preview and margin gauge update live. The tag switches to *Above lane average*. Click **Apply** on the AI suggestion to reset.
- Switch **Include** off on Ocean freight, then back on.
The quote becomes **FOB Tanjung Perak** and ocean freight moves to "Not included". That's the FOB question from Act 2.
- In **Note to customer**, type **Trucking by PT Truk Jaya**.
A red guardrail appears, and the preview shows **[partner]**. Vendor identities can't leak by accident.
- Click **All-in price**; switch currency to **IDR**.
Same quote, presented the way this customer prefers.
- Click **Send to customer** → **Send quote**.
The dialog lists exactly what is shared. All five progress steps are now done.

✓ **Optional:** set every margin to **3**. The main button changes to **Request approval**, because the margin is below the company's 8% floor.

The shipment workspace

3 min

shipment.html

Point: one shipment, many parties, and each sees a different, filtered version. The AI checks every document the moment it's uploaded.

Do

Say / point out

- 1 Click **Shipments** in the purple rail (opens SHP-2411).
- 2 Walk the **milestone timeline**.
- 3 Read the **Documents** AI lines, especially the red one.
- 4 In **Next up**, click **Send back with reason**.
- 5 Click through the **Conversations** tabs.

"The customer accepted. Now it's a live shipment."

Tomorrow's pickup is **Next**; the customs step is at **risk** because the phytosanitary certificate isn't in yet.

"The invoice matches the booking. But the fumigation draft lists only 1 of the 2 containers." That would have caused a customs rejection on Thursday.

The request appears in the fumigation vendor's own thread, and the document becomes *Fix requested*.

One thread per party, so nobody sees anyone else's messages. The bar under the tabs says who can read it.

Staff view: full picture, costs, vendor names.

"View as PT Kopi Nusantara": roles instead of vendor names.

- 6 Top right, set **View as** → **PT Kopi Nusantara**.
- 7 Switch **View as** → **PT Truk Jaya**.

The key moment. Vendors become "Trucking partner" and "Ocean carrier", the vessel becomes "Direct sailing", and costs and the vendor's draft are gone.

The trucker sees only its own two milestones, one document, and its own thread. Click **Exit preview**.

Network and inviting partners

 3 min
network.html

Point: the forwarder builds its own ecosystem. Vendors join by a link, with no account needed, and can claim a free profile later.

Vendor directory with rating, on-time and connection status.

PT Truk Jaya: stats, rate card, history, and what they can see.

Do

1 Click **Network** in the rail. Click the **Trucking** filter, then **All types**.

2 Click **PT Truk Jaya**.

3 Click **Invite** at the bottom of the rail. Type **PT Truk Jaya** as company.

4 Replace it with **PT Ekspres Logistik Timur**, contact **Agus Salim**, WhatsApp **+62 812 3344 5566** → **Continue**.

5 Tick **Trucking**, add a suggested lane → **Continue**.

6 Click **Send invitation**.

7 Click **Marketplace** in the sidebar.

Say / point out

Every vendor with rating, on-time % and status: Connected, Link only, Invited. The network is private.

Performance built from real jobs, their rate card (visible to both sides), shared history linking back to our RFQ and shipment, and a clear **They see / Never shown** panel.

Duplicate check: "already in your network".

WhatsApp or email: whatever the vendor actually uses.

The preview shows the WhatsApp message in **Nusantara Cargo's brand**, plus what they'll see and never see.

It lands in **Invitations** as pending. Show the other states: expired (Resend), accepted, link-only, and a customer asking to connect (click **Accept**).

Phase 2, opt-in and supply side only. Customers never see it.

Other states worth showing

Use for Q&A
or a longer demo

`index.html?state=new` : a brand-new company with no partners yet.

Open this URL

`index.html?state=new`

`index.html?state=loading`

`rfq.html?state=expired`

`shipment.html?as=kopi` (or `truk`, `fumi`, `bea`, `samudra`)

`network.html?state=empty`

`org.html?id=angkut`

`org.html?id=kopi`

`inbox.html`

`rfq.html?state=expired` : deadline passed, ocean leg has no offer.

What it shows

First-time company: empty sidebar and a 3-step setup card.

Loading skeletons on Home.

RFQ past its deadline: award 3 of 4 legs; ocean stays open.
Extend 24h / Ask more vendors.

Opens the shipment already previewed as that party.

No vendors yet: invite or import from a spreadsheet.

A link-only vendor's profile, with "Invite to claim".

A customer profile: revenue (internal), quotes accepted, portal access.

The Inbox with Primary / Other / Later / Cleared tabs; snooze and mark done.

Quick links, limits and FAQ

Keep this page open
next to the demo

Jump straight to an act

Act	URL (prefix <code>http://localhost:5180/</code>)	Starts at
1 · Home	<code>index.html</code>	Overview with sample data
2 · Prompt → RFQs	<code>chat.html</code>	Answer already shown (no streaming). For streaming, start from Home.
3 · Compare & award	<code>rfq.html</code>	6 of 7 replies in
4 · Customer quote	<code>quote.html</code>	Draft quote QT-0891
5 · Shipment	<code>shipment.html</code>	SHP-2411, staff view
6 · Network	<code>network.html</code>	Vendor directory

Known limits of the prototype

- **The AI is scripted.** Every prompt produces the coffee shipment; follow-up messages get a placeholder reply.
- **No persistence.** Reloading any page resets its sample data, and actions on one page don't carry to the next.
- **Some buttons are placeholders.** They show "designed in a later screen" (e.g. Planner, Docs, PDF download, customer portal).
- **Illustrative data.** Companies, prices, rates and regulation notes are made up. Real rules must come from maintained data.
- **Desktop only.** Designed for 1280 px and wider.

Likely questions

Do vendors need to sign up?	No. They can reply to RFQs, upload documents and update status from a WhatsApp or email link. A free profile is optional, and a paid plan makes them a tenant with their own network.
Can a customer see who my vendors are?	Never. Customers see roles ("Ocean carrier"), and the quote builder blocks vendor names in customer-facing text.
Does the AI send anything by itself?	No. RFQs, awards, quotes and bookings always need a person to confirm in a review dialog.
Where do prices come from?	From the forwarder's own vendor replies and rate cards, plus its margin. Never from generic market data.
What's not built yet?	The vendor magic-link page and vendor inbox (next), the branded shipper portal, the marketplace, and analytics.
